The Dos and Don'ts of Cast Care

By Matt Garver, Vice President Marketing, Brownmed

Whatever cast, splint or bandage materials you use, Seal-Tight is the professional post-treatment solution. Avoid cheap alternatives that can leak. Instead, rely on the original—Seal-Tight cast and bandage protectors—to keep casts dry, reduce potential infections and avoid recasting.

You've casted another injury and are dealing with concerns from the patient about an upcoming beach vacation, or simply the ease of doing everyday tasks such as showering or bathing.

Thankfully, your patients don't have to avoid the water just because they're wearing a cast or bandage. Using a waterproof cast and bandage covering is the easy way for your patients to keep water out while you shower, take a bath or play.

Seal-Tight cast and bandage protectors have been on the market for more than 30 years and are the #1 brand in cast and bandage protection worldwide. Today, Seal-Tight offers 34 versions to cover any size cast or bandage and options in adult and pediatric sizing, with models ranging from 11" to 42" in length. They're the easiest way to cover cast and bandage wearers of all ages with extra protection during a shower or bath. Best of all, Seal-Tight products are guaranteed to last the life of the cast.

Whether you're in an orthopaedic, podiatric or general practice, it's your choice—stock the Seal-Tight line conveniently in your office or refer patients to seal-tight.com for the appropriate option. Either way, the choice is in your hands.

A SEAL-TIGHT cast protector keeps patients' casts dry.

Whether you mention the importance of cast protection or not, patients will look for a convenient solution to keeping their casts dry. Without direction, many turn to plastic bags and tape to protect their casts from water. More often than not, this results in a leaky seal and a return trip to your office to have their injury recasted.

Seal-Tight products save time and

medical costs with their latex-free cast covers that are easy to get on and easy to get off. Further, protected beneath a dry cast or bandage, the skin is far less susceptible to infection, and your patients can continue the healing process uninterrupted.

Whatever cast, splint or bandage materials you use, Seal-Tight is the professional post-treatment solution.

The American Academy of Orthopedic Surgeons' Web site recommends the purchase of waterproof shields to keep casts or splints dry while showering or bathing. Seal-Tight is the superior, economical, waterproof solution.

What's more, they're bringing innovation to the market once again. Current iterations of cast protectors may allow pooling around the seal, creating the potential for a rush of water to enter the protector as its being removed. Brownmed solved this issue with the new, patented Seal-Tight Infinity. In a market flooded by knock-offs, Seal-Tight Infinity represents one of the first innovations in the category in over 15 years.

Here's why the Seal-Tight Infinity provides premium protection:

Unique, infinity-edge enhances protection and prevents water from pooling on ring

- Molded grips for easy, no-slip application
- Forms uniform watertight seal on the limb
- Stretches over the cast or bandage without tearing

Clinicians and their patients prefer Seal-Tight protectors because they are easy to use, guaranteed to last the life of the cast and made from high-quality latex-free materials in the USA.

So turn to the market leader—select from a full lineup of models and sizes now, to keep your cast dry, waterproof your bandages and enjoy the water once again!
